WORKING PAPERS	<p>“Automation Threat and Labor Market Power” (Job Market Paper)</p> <p>This paper studies the role of automation threat in firms’ labor market power. Employing the production approach, I show that workers in an average German manufacturer receive 79 cents on the marginal euro. Using automation threat proxied by local labor market regions’ exposure to industrial robots instrumented by plausibly exogenous shift-share factors, I find that robot exposure increases employer power over routine workers in areas with weaker unions in East Germany with spatial frictions. The empirical findings are consistent with the wage bargaining model where employers retain the “right-to-manage” their workforce composition and unions representing different workers separately bargain with the firm.</p> <p>“Artisanal Mining and Intimate Partner Violence in Sub-Saharan Africa” (with Anh Nguyen), <i>Under Review</i></p> <p>We study the impact of changes in employment and income opportunities induced by artisanal mining on violence within the household. We leverage spatial variation in gold suitability and exogenous temporal variation in global gold prices, conditional on industrial mining and environmental factors, to examine how changes in women’s economic conditions relative to men due to mining activities affected the risk of intimate partner violence. Using representative data from over 30 countries in Sub-Saharan Africa, we document that the profitability of artisanal gold mining increased female employment in mining and retail industries, improved women’s intrahousehold bargaining power, and reduced domestic violence.</p>

“Alcohol Consumption and Intimate Partner Violence: Long-Term Effects of Temporary Alcohol Ban” (with Arnab K. Basu and Nancy H. Chau)

This study traces the impact of a partial liquor ban – from launch to reversal – on alcohol consumption and intimate partner violence. We decompose the long-run effects of a temporary and selective liquor ban on drinking behavior and women’s experience with intimate partner violence to include a policy impact and a policy reversal effect. Leveraging neighbor states comparable and sufficiently isolated in our context as the control group, we employ difference-in-differences and event-study approaches to identify the causal impacts of a policy that shuts down hard liquor-serving local bars. We find that alcohol consumption in bars significantly reduced over the policy period and rebounded after the policy removal, with no impacts on home drinking. Consistent with a policy-induced change in the volume of alcohol consumption during and after the alcohol ban, we find that physical violence declined during the prohibition and overshot its starting level following the reversal only in high-wealth households, the primary consumers of expensive hard liquors most likely affected by the ban.

“Public Works Program, Labor Supply, and Monopsony” (with Nancy H. Chau and Vidhya Soundararajan)

This paper studies the role of changes in workforce composition in monopsony power. We develop a monopsony model in which a firm’s wage markdown—the wedge between MRPL and wage—is a weighted average of markdowns for heterogeneous workers. We empirically illustrate the theory using India’s National Rural Employment Guarantee Act (NREGA), which generates non-manufacturing jobs in rural areas. Consistent with the model predictions, at manufacturing firms, we find that the program increases average markdowns by crowding out mobile workers and effectively increasing the share of immobile workers with low labor supply elasticity.

RESEARCH IN
PROGRESS

“Capital Market Integration, Labor Market Distortion, and Labor Misallocation” (with Nancy H. Chau, Anh Nguyen and Vidhya Soundararajan)

This paper examines the labor market effects of foreign capital liberalization in India, with a focus on labor misallocation and employer market power—a key source of misallocation. We estimate the firm-specific labor markdowns—wedge between MRPL and wage—as a proxy for monopsony power. Exploiting a foreign direct investment liberalization episode as a natural experiment, we employ difference-in-differences and event study designs to identify the causal impacts of capital market integration on the labor market. For firms with ex-ante high MRPL, liberalization increases employment by 22% and wage bills by 20% and reduces MRPL by 11% and labor markdowns by 13%, with no impact on wages relative to low MRPL firms. These labor market effects are driven by industries with initially low foreign capital exposure, compared to those with high exposure that received most of the foreign capital inflows. This finding suggests that capital market integration reduced labor misallocation through the general equilibrium or competition effect. The labor market effects of foreign capital liberalization are pronounced for male and production workers.

“On the Intra-Household Public Goods and Fertility Trade-Off” (with Arnab K. Basu and Nancy H. Chau)

This paper explores an infinite-horizon dynamic model of intra-household public goods, fertility, and child mortality in which child survival is subject to the provision of household public goods. An overlapping generation model we developed explains the empirically observed relationship between fertility rate, household-level public goods, and infant mortality. In this framework, the household public goods provision reduces child mortality and enhances the earning capacity of surviving children. The model demonstrates how intra-household public goods provision is associated with fertility decisions through its impacts on child health and parents’ earning potential in the long run. The model with endogenous household public good provision and intergenerational transfer suggests that households make trade-offs between intra-household public goods and fertility conditional on the survival probability of offspring, a complement of child mortality.
