WORKING PAPERS	<b>“Automation Threat and Labor Market Power”</b> (Job Market Paper) This paper studies the role of automation threat in firms’ labor market power. Employing the production approach, I show that workers in an average German manufacturer receive 79 cents on the marginal euro. Using automation threat proxied by local labor market regions’ exposure to industrial robots instrumented by plausibly exogenous shift-share factors, I find that robot exposure increases employer power over routine workers in areas with weaker unions in East Germany with spatial frictions. The empirical findings are consistent with the wage bargaining model where employers retain the “right-to-manage” their workforce composition and unions representing different workers separately bargain with the firm.	
	<b>“Alcohol Consumption and Intimate Partner Violence: Long-Term Effects of a Temporary Alcohol Ban”</b> (with Arnab K. Basu and Nancy H. Chau), <i>RFBerlin Discussion Paper 162/25, Under Review at The Review of Economics and Statistics</i>	
	We trace the impact of a temporary ban targeting liquor-serving bars – from launch to reversal – on alcohol consumption and women’s experience with domestic violence in Kerala, India. Decomposing the policy-	

induced and reversal effects by employing difference-in-differences and event-study approaches, we identify a significant reduction in alcohol consumption (but only in bars) with an accompanying reduction in intimate partner violence during the policy period. However, both alcohol consumption and domestic violence rebounded to pre-ban levels after the policy removal. Heterogeneity analysis further reveals these effects to be confined only amongst high-wealth households. A battery of robustness tests confirms our findings.

**“Public Works Program, Labor Supply, and Monopsony”** (with Nancy H. Chau and Vidhya Soundararajan)

This paper studies the role of changes in workforce composition in monopsony power. We develop a monopsony model in which a firm’s wage markdown—the wedge between MRPL and wage—is a weighted average of markdowns for heterogeneous workers. We empirically illustrate the theory using India’s National Rural Employment Guarantee Act (NREGA), which generates non-manufacturing jobs in rural areas. Consistent with the model predictions, at manufacturing firms, we find that the program increases average markdowns by crowding out mobile workers and effectively increasing the share of immobile workers with low labor supply elasticity.

**“Artisanal Mining, Female Labor Supply, and Intimate Partner Violence”** (with Anh Nguyen)

This paper uses micro data from over 30 countries in Sub-Saharan Africa to present nearly continent-wide evidence that the rise in the potential value of artisanal mining leads to a structural transformation from the agricultural to the non-agricultural sectors. Leveraging spatial variation in gold suitability and exogenous temporal variation in global gold prices, we show that employment activities in the mining and retail industries increase more for women than men. An increase in women’s intrahousehold bargaining power results in a decrease in violence within the household, ruling out a potential backlash effect.

**“On the Intra-Household Public Goods and Fertility Trade-Off”** (with Arnab K. Basu and Nancy H. Chau)

This paper explores an infinite-horizon dynamic model of intra-household public goods, fertility, and child mortality in which child survival is subject to the provision of household public goods. An overlapping generation model we developed explains the empirically observed relationship between fertility rate, household-level public goods, and infant mortality. In this framework, the household public goods provision reduces child mortality and enhances the earning capacity of surviving children. The model demonstrates how intra-household public goods provision is associated with fertility decisions through its impacts on child health and parents’ earning potential in the long run. The model with endogenous household public good provision and intergenerational transfer suggests that households make trade-offs between intra-household public goods and fertility conditional on the survival probability of offspring, a complement of child mortality.
